

# Team Raspberry - Image Classification

Kristian Wahlroos   Ilkka Vähämaa   Sean Lang

December 15<sup>th</sup>, 2017

## Overview

## Results

## Final System

## Methods

# Results

- ▶ Thing1
- ▶ Thing2

Figure: caption text

# Methods

## Data representation

- ▶ Treat every image as a 3D-tensor (RGB)
  - ▶ Repeat the value of grayscale images three times
  - ▶ Colorized are handled as the original tensors
- ▶ Original data has 14 labels, we used 15
  - ▶ Extra one for the unclassified images
  - ▶ One-hot encoded labels

# Methods

## Data processing

- ▶ Read images in batches of size 2000
  - ▶ Helps to avoid filling the RAM
- ▶ Normalize the pixel values between  $[0.0, 1.0]$
- ▶ For every batch augmenting the data
  - ▶ Provided by Keras
  - ▶ Centerify, shear, zoom, rotate and flip
  - ▶ To get more variation and samples from classes with few labels

# Methods

## Class weights 1/2

- Classes are very unbalanced

Figure: Class distribution

# Methods

## Class weights 2/2

- ▶ We tackled this problem by custom weights per class
  - ▶ Giving them at training phase

## Class weight function

$$S(c_i; \lambda) = \ln \left( \lambda \frac{\sum_c |c|}{|c_i|} \right)$$

$$W(c_i; \lambda) = \max(S(c_i; \lambda), 1)$$

# Methods

## Network topology

- ▶ One network that outputs 15 classes
- ▶ Three convolution layers all followed by max pooling
  - ▶ Filters 32, 32, 64
  - ▶ Kernel size 3x3
  - ▶ Max pool size 2x2
  - ▶ ReLu as activation function
- ▶ After pooling flattening via dropout to dense layer with sigmoid activation
  - ▶ Dropout value: 0.4
- ▶ Very simple network

# Methods

## Loss function

- ▶ Categorical crossentropy wouldn't work as one image can be in many classes
- ▶ Binary crossentropy was suggested in many forum posts
  - ▶ Still not viable solution when there are many overlapping categories
  - ▶ Loss is too forgiving for giving 0 labels
- ▶ Solution: "custom" loss function **BP-MLL**<sup>1</sup>
  - ▶ Actually taken directly from the paper [1]<sup>2</sup>
  - ▶ Designed for multi-label problems
  - ▶ Implementation for Keras can be found from internet
  - ▶ Punishes more from just giving 0 labels
